

Git Cheat Sheet

git clone <https://github.com/Pastfran/potential-spoon.git>

-> creates an identical working directory?

git add [filename]

-> adds file to the to be committed to repository pile

git commit -m "[commit text]"

-> commits file(s) from "add-pile" to the repository, commit text should be descriptive

git push

-> will ask for username and long token, copy token via right click possible -> will "synchronise" remote repository

git mv [old file name] [new filename]

-> renames file or converts file type! -> If done manually in explorer git sees it as a new file and loses all version information!!

git status

-> status of working directory and staging area

git cat [filename]

-> shows contents of file
